TELETYPESETTER DELAY STARTING SWITCH ATTACHMENT F-8914

A Teletypesetter Delay Starting Switch Assembly (F-8914) has been designed, which has the function of delaying the Teletypesetter Operating Unit for a sufficient period of time between each line to permit matrices to be redistributed to the Magazine. Switch (F-8914) accomplishes this delay by stopping the operating unit after each line until the line delivery returns to normal position. This is especially desirable when setting long line lengths of (16) Picas or over by Teletypesetter since it insures sufficient matrices being in the Magazine for the proper assembly of the next line.

OUTSTANDING MODELS

Can be applied to all Comets equipped with Comet Teletypesetter Operating Unit having Stop Magnets. Use Mailing Sheet #641.
