

MAT GLIDE SECOND ELEVATOR (COMET)

A new second elevator mechanism has been designed to control the motion of the second elevator bar and link to eliminate the possibility of premature wear of teeth of the second elevator bar and the matrices. It also provides quieter second elevator operation at higher speeds.

The new mechanism controls the second elevator bar link as the second elevator leaves the intermediate channel and as it seats in the upper second elevator guide position, to eliminate the abrupt rotation of the link.
